ABSTRACT

Semantic wikis augment wikis with semantic properties that can be used to structure content that can therefore be aggregated and queried through reasoning. Semantic wikis have been adopted by many communities for very diverse purposes, such as organizing genomic knowledge, coding software, learn about hobbies, and tracking environmental data. Although wikis have been analyzed extensively, there has been little analysis of the use of semantic wikis. In this paper, we analyze the formalization of knowledge in 230 semantic wiki communities. We report our findings in terms of the edits of semantic concepts and properties, as well as the communities of editors for these semantic features of the wikis.

Author Keywords

Semantic wikis; semantic web; social knowledge collection.

ACM Classification Keywords

H.5.2 [Information Interfaces and Presentation]: User Interfaces - Interaction styles.

INTRODUCTION

Wikis are one of the most popular frameworks for collaborative knowledge collection on the Web. Wikis are easy to use, track the history of all edits and their provenance, and scale well to thousands of users. Wikis sometimes have conventions that provide structure to their content. For example, Wikipedia has infoboxes to organize basic information for some types of wiki pages such as athletes, politicians, and countries. But even though infoboxes can be the basis for automatic extraction of knowledge bases from Wikipedia [Auer et al 2007; Weld et al 2008], the wiki itself cannot understand their structure or reason about their content. In contrast, semantic wikis augment wikis with the ability to structure information

through semantic annotations in RDF, for example through defining classes and properties [Bry et al 2012]. As a result, the contents of a semantic wiki can be aggregated and queried. Visualizations can be created by overlaying semantic information in maps or charts. While wikis can be seen as sites for social content collection, where people come together to share information in a virtual community, semantic wikis can be seen as frameworks for *social knowledge collection* where contributors structure content and organize it into knowledge structures [Gil 2013].

Semantic wikis are becoming very popular, as they offer the simplicity of a wiki with additional capabilities to organize content. There are hundreds of installations of semantic wikis used for very different purposes and communities. Some semantic wikis have a serious use, such as scientific knowledge organization. Others focus on hobbies, for example gardening or restaurant directories. Some wikis have users that are on the younger side, such as teens who are Yu-Gi-Oh card traders and want to organize all the information about the different characters in the cards.

Semantic wikis are an example of knowledge capture in the wild, where non-experts design and use knowledge structures in an organic way. Semantic wikis can be seen as a microcosm of the Semantic Web, since users exploit semantic web technologies while retaining a very accessible Web collaboration interface. While there have been many analysis of wiki communities (e.g. [Kittur et al 2009; Leskovec et al 2010]), there are no longitudinal studies about social knowledge collection in semantic wikis.

In prior work, we carried out an analysis of 20 semantic wikis regarding the creation of semantic properties [Gil et al 2013]. The wikis had a varying amount of users editing semantic properties, and we found some patterns that were common across wikis. That initial analysis was small and limited to property editing, but already raised the question of whether the patterns would occur in a larger set of wikis.

This paper presents an analysis of 230 semantic wikis, focusing on how users edit wikis to add structure to the contents. We analyze the concepts and properties created, the amount of editors involved in creating them, and the amount of edits for concepts and for properties. This

analysis contributes to the understanding of semantic wikis as a platform for social knowledge collection, and suggests improvements for the design of semantic wikis.

RELATED WORK

[Bry et al 2012] gives a detailed overview of semantic wikis and a thorough comparison of two dozen alternative implementations, which include Semantic MediaWiki [Krötzsch et al 2007], OntoWiki [Auer et al 2006], and AceWiki [Kuhn et al 2009].

While there are many published analyses of wikis, semantic wiki communities have not been studied in depth. Many studies are focused on Wikipedia, with topics as varied as the editorial process [Spinellis and Louridas 2008], incentives to contributors [Leskovec et al 2010], critical mass of contributors [Raban et al 2010], coordination across contributions [Kittur et al 2009], group composition [Lam et al 2010], conflict resolution [Kittur and Kraut 2010], and user interaction design [Hoffman et al 2009]. Other work focuses on automatic extraction of structured content from wikis [Auer et al 2007; Weld et al 2008].

Structured knowledge collection from volunteers has been studied in prior research, including OpenMind [Lieberman et al 2004], the Cyc FACTory [Matuszek et al 2005], and Learner [Chklovski and Gil 2005].

SEMANTIC WIKI DATA

We used data from 230 semantic wikis, all installations of Semantic MediaWiki so the data would be comparable. There is a list of Semantic MediaWiki installations¹, with 489 sites at the time of this analysis. The wikis vary widely in topic, community, scope, size, and language. Of those, we selected those listed as active, which was a total of 362 wikis. From those, we selected those that had an easily accessible API and allowed anonymous read access which were a total of 255. Some wikis were unresponsive, which left us with 238 wikis. Of those, we removed several that had been clearly created by semantic web researchers, since we wanted to focus our analysis on the use by non-experts. Our final corpus contains 230 wikis.

Table 1 shows the metrics that we compiled for each wiki. The data was obtained through the Semantic MediaWiki API. For each wiki, we extracted the structured properties defined, noting each of the edits made to those properties and by what editors. We also extracted the concepts defined, the edits to those concepts and the editors. We also extracted counts of total number of pages, page edits, and total number of editors. The API does not provide some data that we would have wanted to collect, such as the number of properties or assertions in a given page. Although contributor data is publicly accessible through wiki history pages, that structure would need to be extracted for further analysis.

Table 1. Metrics of editor activities in semantic wikis.

Metric	Description
SC	Semantic concepts defined
SCC	Concept creators who edited concepts
SCE	Concept edits that changed concepts
SP	Structured properties defined
SPC	Property creators who edited structured properties
SPE	Property edits that changed structured properties
SPA	Property assertions
PP	Pages in the wiki
PPC	Contributors to the wikis that made any edits to pages
PPE	Page edits

Table 2. Semantic wiki indices indicative of the proportion of semantic-related metrics to the overall size of a wiki.

Index	Description
SC-Index	SC/PP
SP-Index	SP/PP
SPA-Index	SPA/PP
SPC-Index	SPC/PPC
SPE-Index	SPE/PPE
SPE-Density	SPE/SP
SPA-Density	SPA/SP

We removed the data for anonymous users. Although some of them might be making legitimate contributions, most anonymous users create spams in wikis and we wanted to eliminate that effect. Legitimate contributors normally want to be part of the community and be credited for their contributions, so they would not typically be anonymous. We also removed data for users blocked by the admins.

We separated the data from users identified as bots. Bots are sometimes set up in wikis to create content automatically. For example, a user may create a bot to import objects from an existing external site and create a page for each object. In the case of some wikis, their contents are almost entirely created by bots. This enabled us to differentiate contributions from bots and from users.

To compare the metrics collected across wikis of different sizes we defined several indices, summarized in Table 2, that assessed each wiki relative to its overall size:

- *SC-Index*: is the proportion of concepts defined in the wiki over the total amount of pages
- *SP-Index*: is the proportion of semantic properties defined in the wiki over the total pages
- *SPA-Index*: the proportion of property assertions over the total amount of pages
- *SPC-Index*: the proportion of semantic property contributors over the total contributors to the wiki
- *SPE-Index*: the proportion of semantic property edits over the total amount of edits to the wiki
- *SPE-Density*: the proportion of semantic property edits to the total amount of properties
- *SPA-Density*: the proportion of property assertions to the total amount of properties

All the metrics and indices have a corresponding one for human edits, named with a “-H” suffix.

USE OF CONCEPTS

Defining concepts is one way for wiki users to create semantic structures in a wiki. One could view a wiki as being more semantic when more concepts are created and edited by more users.

Table 3 shows the data for wikis with more than 2 concepts defined ($SC>2$), 29 in total. It shows total pages, concepts defined, concept creators, and concept edits. We show these totals for all users (humans and bots) and human users only. Of the 230 wikis that we analyzed, only 53 wikis had concepts defined.

Concept Definitions

Table 3 shows that only 3 wikis had more than 100 concepts defined ($SC>100$), and only 15 had between 99 and 5 concepts defined ($99>SC>5$).

Only 10 wikis had an SC-Index over 0.02 (Digitabulum, Read Write Book Club, Virtual Skipper, Eroge, Detective Conan, WikiTranslate, NeuroLex, Stargate, Bioinformatics Core, and Säsongsmat). 9 other wikis had a value of 0.01, the rest had a value of 0.

Only 11 wikis had an SC-H-Index over 0.02 (Digitabulum, Read Write Book Club, Virtual Skipper, NeuroLex, Eroge, Free Software Directory, Detective Conan, WikiTranslate, SaveMLAK, Stargate, and Bioinformatics Core). 9 wikis had a value of 0.01, the rest had a value of 0.

Concept Contributors

Only 3 wikis had more than 10 concept contributors (shown in the table with $SCC>10$). Only 4 wikis had between 9 and 3 concept contributors. 4 wikis had 2, and 42 wikis had 1 concept contributor. The rest had 0.

Most contributors were humans, and many wikis had 1 or 2 bots contributing concepts. There was 1 wiki (Säsongsmat) with all concepts (31) created by 1 bot, with 59 edits (total pages: 1766).

Concept Edits

5 wikis had more than 100 edits (shown in the table). 19 wikis had between 99 and 10 edits.

USE OF STRUCTURED PROPERTIES

The use of structured properties defined in a wiki is also correlated with the use of semantic aspects of the wiki. Ultimately, the utility of the properties is to create assertions about objects in the wiki. The more assertions made in the wiki, the more its semantic features are being used.

Property Definitions

Table 4 shows a list of wikis with more than 200 properties defined ($SP>200$), 18 wikis in total. Their SP-Index ranges from a value of 0.01 in Enipedia to 0.49 in CSDMS.

All 230 wikis had some property defined. 50 wikis had more than 100 properties defined ($SP>100$), and an additional 53 wikis had more than 50 properties ($100>SP>50$). Only 19 wikis had less than 10 properties defined.

Table 5 shows the wikis with the highest SP-Index. Several wikis have an SP-Index greater than 1. For most wikis, the index is smaller than 1, which means that some pages have no properties defined for them.

Property Creators

Table 6 shows the wikis with more than 10 property creators ($SPC>10$), with 12 wikis total. Only 1 wiki (TermWiki) had more than two dozen creators. The SPC-Index is 0.00 for many of the wikis. It is non-zero for 4 of the wikis, with 0.06 in NeuroLex and even 2.22 in TermWiki.

Table 7 shows the wikis with the highest SPC-Index. TermWiki and Neurolex also appear in this list, but many other wikis appear here that were not in Table 6.

Property Edits

Table 8 shows the wikis with more than 400 property edits ($SPE>400$), with 17 wikis total. All wikis but 1 have less than 25 property creators. The exception is TermWiki with 745 property creators. The SPE-Index ranges from 0.01 in Enipedia to 0.79 in CSDMS and 0.92 in WikiDeb, with the highest value as 6.93 in TermWiki.

Table 9 shows the wikis with the highest SPE-Index. TermWiki appears in this list. Two other wikis have a higher value for this index, but they are both quite small in size (PP).

Table 4. Semantic wikis with more than 200 structured properties.

Table 12 shows wikis with a SPA-Index over 100, a total of 20 wikis. 127 wikis have a value above 10, 49 wikis had a value between 1 and 10. Table 13 shows the 100 wikis with the highest SPA-Density, all have a value above 300. The highest is over 134,000 for 911datasets.org. There are 12 wikis with higher than 12,000. It is over 100 for 150 wikis, and is between 10 and 99 for 27 wikis.

DISCUSSION

Of the 230 semantic wikis analyzed, 25% had no semantic concepts defined. Users in a large proportion of wikis do not seem interested in using this feature. It is possible that wiki page “categories” are being used in lieu of concepts.

We collected data about the number of categories and the number of category assertions in the wikis. As suspected, categories are far more popular than concepts, with 43 wikis having more than 1,000 categories and only 15 wikis with no categories. Further investigation is required to determine the reasons for the limited use of concepts.

The use of structured properties was much more widespread. All wikis had some property defined. 50 wikis had more than 100 properties defined.

The creation of property assertions is done at large volumes across all wikis.

The number of property creators was below two dozen for all but one wiki. This suggests that adoption and normalization of properties as well as resolution of conflicts among property definitions may be confined to a small subset of users. In fact, some wikis have established editorial processes for semantic properties. For example, the Battlemaster wiki states the following policy:

“Do not create new properties without approval. Properties listed in the table below can be added to pages or templates as appropriate. If you need a property that is not yet defined, make a suggestion on the talk page. Any and all properties added to the wiki without approval will be deleted and all changes to your pages that use them will be reversed.”

It is possible that many more wikis have similar policies. Further investigation of the dynamics of the creation of semantic properties would reveal whether potential conflicts are collaboratively detected and resolved.

Many semantic edits are done by bots. However, the vast majority is done by humans. We did not have data about whether property assertions were done by bots (i.e., an SPA-H metric), since that data is not available from the API and would have to be extracted from the wiki history pages.

From our analysis, it appears that the adoption of semantic wikis is in large part due to the ability to create semantic properties and use them to make assertions.

It would be useful to understand the interplay between property edits and growth of the wiki. Figure 1(a) shows edits over time for all the wikis. We separated wikis that had editing spikes, defined as having more than 30% of edits in any one month. Wikis with no editing spikes are shown in Figure 1(b). The spikes of growth for the wikis shown in Figure 1(c) could be correlated to the definition of semantic properties. Investigating this would require extracting details of what edits were done to each page in a finer granularity than what is available through the API.

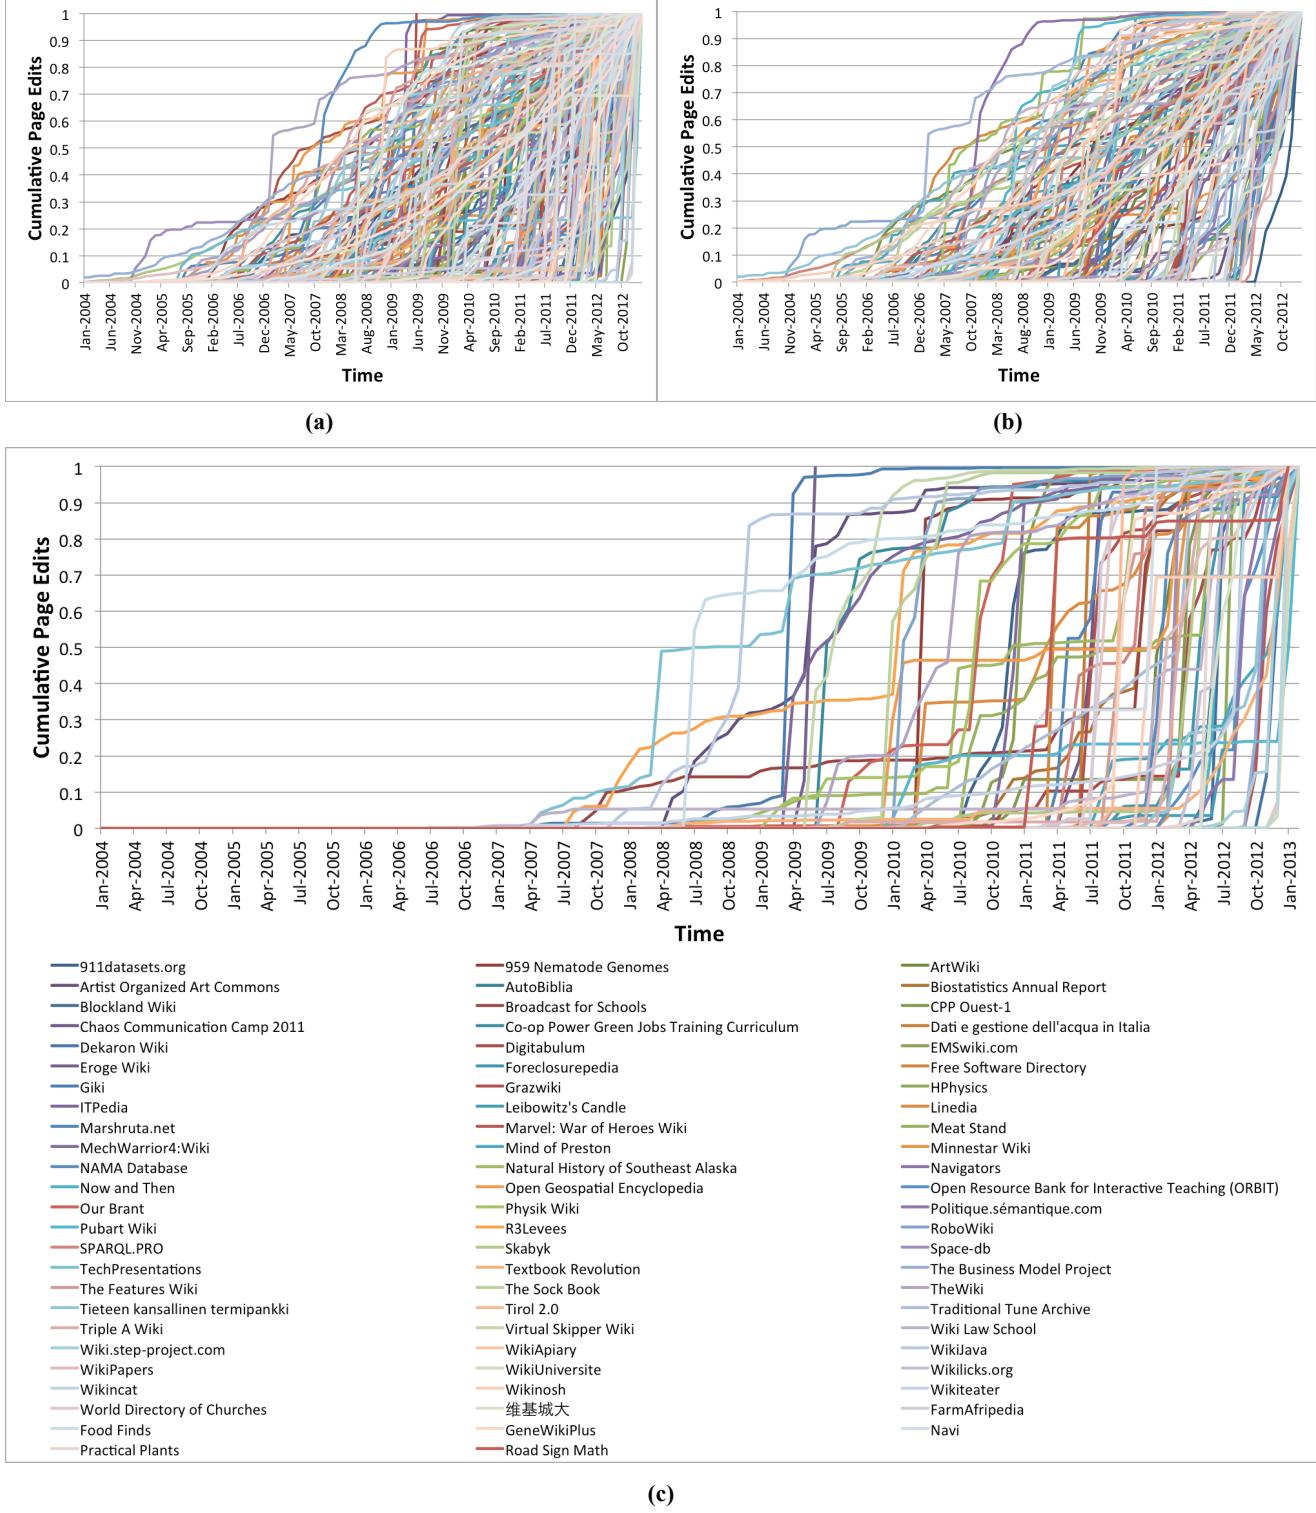

Figure 1. Wiki edits over time, showing (a) edits over time for all wikis, (b) the subset of wikis with no editing spikes, (c) the subset of wikis with editing spikes.

CONCLUSIONS

In this paper, we report on an analysis of 230 semantic wikis regarding the creation of semantic concepts and properties as well as assertions. We collected data about their creation and edits, as well as the wiki users who edited

them. We found that concepts are not used very often, and not used at all in many wikis. Properties were used in all the wikis, although very small numbers of users edit them. Very large numbers of property assertions are used in almost every wiki.

An important challenge is to understand the limited use of some semantic features of the wiki, such as defining concepts, as well as the small number of users who make property definitions. The extent of use and enforcement of restrictive editing policies should be further investigated. It is possible that additional users would be involved in the creation of properties if there were facilities in the wiki to detect and resolve conflicts collaboratively. A future research direction is to investigate extensions to semantic wikis that proactively prompt users to define concepts or properties, detect inconsistent definitions, and mediate their resolution.

There are hundreds of communities that are using semantic wikis for social knowledge collection. They are collaboratively creating structured content. Improving the ability of all users to contribute to the semantic aspects of the wiki will help extend the use of knowledge-rich systems and broaden the adoption of semantic web technologies.
